

BANKING INFORMATION SYSTEM

Submitted By: Hemraj Barad

Internship: Internship in Embedded and IOT

Certificate / Declaration

I hereby declare that the project titled “Banking Information System” is my original work completed during the Embedded and IOT Internship at Upskill Campus.

1. Abstract

This project is a console-based Banking Information System developed using Core Java. The application allows users to create an account, deposit money, withdraw money, check balance, and view account details through a menu-driven interface. The project demonstrates fundamental Java programming concepts such as classes, objects, constructors, encapsulation, methods, loops, and switch-case statements.

2. Introduction

Banking systems are widely used to manage customer accounts and financial transactions. This project simulates basic banking operations and helps beginners understand how real-world banking applications work using Java.

3. Objectives

- To develop a menu-driven banking application.
- To implement deposit and withdrawal operations.
- To maintain account balance.
- To apply Object-Oriented Programming concepts in Java.
- To improve problem-solving and programming skills.

4. Technologies Used

Technology	Purpose
Java	Programming Language
JDK	Compilation & Execution
Scanner Class	User Input
OOP Concepts	Program Structure

5. System Design

Modules

- Account Creation
- Deposit Money
- Withdraw Money
- Check Balance
- View Account Details
- Exit

6. Algorithm / Flow

1. Start the program.
2. Accept account holder details.
3. Display menu options.
4. Perform selected operation.
5. Update and display balance.
6. Repeat until Exit is chosen.
7. Stop the program.

7. Program Explanation

BankAccount Class:

- Stores account details.

- Contains methods for deposit, withdrawal, balance check, and displaying details.

BankingInformationSystem Class:

- Contains the main() method.
- Displays the menu.
- Handles user input and operations.

8. Output Screenshots

11. Results

The Banking Information System successfully performs all banking operations including deposits, withdrawals, balance inquiry, and displaying account information.

12. Conclusion

This project helped in understanding Core Java programming and Object-Oriented Programming concepts. It demonstrates how a simple banking application can be developed using Java.
